## RETROLINKS™ ON SEVERAL STRUCTURES – PLUS A VAMP CLAMP™: GULF OF MEXICO

### Several smaller platforms retrofit

Deepwater was contracted to provide RetroLink™ anode strings for three smaller Gulf of Mexico platforms near the Louisiana coast, and a VampClamp™ continuity clamp on a much larger platform nearby.

One platform in 150-foot depth with four legs and four risers was retrofit with 11 RetroLinks™, each 150 feet in length with 25-foot leaders and were installed on horizontal weld-on stand-offs. Two other structures, smaller caissons in 66 feet of water, each got three 66-foot RetroLinks™ with 25-foot leaders attached via vertical weld-on stand-offs.

The fourth – and largest – platform needed a VampClamp™ installed on an insulated riser flange. The VampClamp™ ensures electrical continuity to both sides of insulated flanges.

More info at [www.stoprust.com](http://www.stoprust.com)

**QUICK INSTALLATION IN 66 FEET OF SEAWATER**  
RetroLinks™ are almost always installed from a small boat without divers.

**PLATFORM IN 150 FT. DEPTH**  
11 longer 150' RetroLinks™ with 25' leaders were used.

**PLATFORM IN 66 FT. DEPTH**  
Three 66' RetroLinks™ with 25' leaders were used.

**DEEPWATER'S VAMP CLAMP™ INSTALLED**  
The Vamp Clamp™ ensures electrical continuity across insulated flanges..

**(ANOTHER) PLATFORM IN 66 FT. DEPTH**  
Three 66' RetroLinks™ with 25' leaders were used.

**PLATFORM RISER WAS ELECTRICALLY ISOLATED**  
A VampClamp™ now provides electrical continuity.

**THE RETROLINKS™ WERE HUNG FROM WELDED-ON STAND-OFFS.**  
At least two of the anodes on each string lie in the mud.
